

# MILLIPEDE

The oldest known fossil millipede specimens are from the Devonian period (417 to 354 million years ago). With their structure having been unchanged over hundreds of millions of years, they are just another of the innumerable species that challenge the theory of evolution. This fossil millipede in amber is 45 million years old. The fact that millipedes of 300 million years ago, and those of 45 million years ago are all identical to living specimens has demolished all Darwinist claims with regard to the origin of life.
