

NEEDLEFISH

If Darwinists' claims that living things descended from one another were true, then we should encounter a large number of fossil specimens bearing the characteristics of two different life forms (such as a half-needlefish and half-herring, or a half-whale and half-shark, or a half-trout and half-crocodile). But no such fossil has ever been found. In fact, Darwin saw that this absence of proof posed a major dilemma for him even when he first launched his theory. For that reason, he wrote the following in the chapter "Difficulties on Theory" in his book *The Origin of Species*: "Why, if species have descended from other species by insensibly fine gradations, do we not everywhere see innumerable transitional forms? Why is not all nature in confusion instead of the species being, as we see them, well defined? . . . But, as by this theory innumerable transitional forms must have existed, why do we not find them embedded in countless numbers in the crust of the earth?" (Charles Darwin, *The Origin of Species*, New York: Oxford University Press, 1998, pp. 140, 141) Some 150 years after Darwin's time, the problem facing evolutionists is exactly the same. Although millions of fossils have been unearthed to date, why has not one intermediate-form fossil been found? The answer is obvious for anyone who does not think along the lines of Darwinist preconceptions: because no "intermediate forms" ever existed! Life forms did not come into being by descent from one another. Almighty God has created all living things, together with the magnificent characteristics they possess.
